largest range

+0.42 m
worst surge

## Summary

Every station in the network logged through the year, with 1.4% of days lost to outages, most of them at the buoys during the November storms. The east channel gauge was resurveyed after the August dredging: its offset moved by 3 cm, and every reading since has been corrected.

The largest tidal range of the year, 3.66 m, came with the king tide of 3 December. The worst surge came on 11 February, when the water stood 0.42 m above the prediction for two hours either side of the 02:30 high water.

## Ranges by station

| Station | High (m) | Low (m) | Range (m) |
|---|---|---|---|
| North Pier | 3.48 | 0.44 | 3.04 |
| East Channel | 3.27 | 0.58 | 2.69 |
| Salt Marsh | 3.01 | 0.97 | 2.04 |
| Headland | 3.61 | 0.39 | 3.22 |
| Oyster Reef | 3.22 | 0.71 | 2.51 |

## The channel

The 2 m contour around the oyster reef has moved about 30 m north since the 2021 survey, as the reef grows. The dredged channel is holding its depth: no point surveyed in October was shallower than 4.1 m at chart datum.
